Dominic Beletti-Naccarato
Cmpt220-201 project idea

      Originally I wanted to make a simple twitter bot that would automate simple tasks such as liking posts containing a keyword or tweeting simple phrases. This is a very hard and time consuming task so I am not yet sure if I want to commit to making it. On the other hand I was considering making an encryption code that would have multiple different encryption types that would all be run on a given phrase and would spit out the encrypted code and a key that would be entered when trying to decrypt it that would tell the code which decryption to use to get the correct phrase back and print it out. Both would Take a significant amount of time and I am looking into how do do both and will decide shortly.

I like the twitter bot idea
